

1. Introduction

This is a synthetic GrokRxiv test fixture PDF used by the preview-acceptance Playwright spec. It is deliberately small (so the repo stays lean) but contains enough extractable text to clear the orchestrator's 200-character low-text guard. The paper is not real research.

2. Background

GrokRxiv runs a typed multi-agent review DAG. The preview path extracts text, runs a single Claude pass to produce a structured MetaReview, and returns the rendered HTML plus a base64-encoded zip bundle of all artifacts. This fixture exercises every step of that pipeline.

3. Methodology

The fixture's only methodology is: place enough plain ASCII text into a one-page PDF that the pdf-extract Rust crate yields more than two hundred characters when invoked on the bytes.

4. Results

No results are claimed. This is a smoke fixture, not a paper.

5. Discussion

Downstream tests assert that an upload of this fixture reaches the 'Sample ready' state in the web dropzone, that the resulting iframe renders a TL;DR section, and that the download bundle anchor points at a non-trivial blob: URL.

6. Conclusion

If you are reading this from inside the Playwright trace, the upload-acceptance test ran. If you are reading it inside the iframe preview, the rendered HTML pipeline executed end-to-end.
